

# Replication - Agricultural idle time and armed conflict

## Applied Stats II

Due: March 31, 2024

### Introduction

The aim of this project is to replicate the main figures and tables of the main findings found in the manuscript. Understand the method and approach used in the research and re-analyse the study using the knowledge gained from Stats I and Stats II with the aim to make a contribution.

The scope of this project is on files: "Readme.txt" the instructions for a replication success, "DHR 2023 replicationA.do" the code used to create the main tables and figures, and ALLDataMerged 15May2023 weigted.dta the dataset that serves as repository because contains the SCAD, ACLED and UCDP-GED datasets combined.

In the next sessions you will find a brief explanation of the journal, the steps in the process of replication, and you also going to find the code in R and Stata to produce the main tables.

### Research Question

The study aims to investigate the relationship between agricultural idle time and armed conflict in African countries.

### Theoretical Hypothesis

Higher levels of agricultural idle time will be positively associated with the likelihood of observing armed conflict events.

### Data Collection

The academic paper of Agricultural idle time and armed conflict and its replication files can be found in Harvard Dataverse. Here there is a list of the files found it and the possible outcome of each of them:

- Africa admin1.dbf: This is a dBASE Table file for an ESRI Shapefile. Shapefiles are a common format used in geographic information systems (GIS) for storing geospatial vector data.

- Africa admin1.shp: This file contains the main geometry data in ESRI Shapefile format. It likely represents administrative boundaries or other geographical features relevant to the study.
- Africa admin1.shx: This file contains the shape index data for the ESRI Shapefile. It helps link the geometry information in the .shp file to attribute data in the .dbf file.
- AllDataMerged 15May2023 weighted.dta: This is a Stata binary file (.dta) containing merged data used in the analysis. It seems to be the primary dataset for the study.
- btscs-a-binary-time STATA.pdf: This PDF file might contain additional information, such as the methodology, results, or supplementary analyses conducted in Stata.
- btscs.rar: This is a compressed archive file (.rar) that likely contains additional Stata do-files or other supplementary materials related to the analysis.
- DHR 2023 LogFile.smcl: This file is written in Stata Markup and Control Language (SMCL) and may contain log output from the Stata analyses conducted for the paper.
- DHR 2023 replicationA.do: This is a Stata do-file (.do) containing replication code or commands used for one part of the analysis.
- DHR 2023 replicationB Map.do: Another Stata do-file (.do) containing replication code or commands, possibly related to mapping or visualizations.
- ReadMe.txt: This plain text file likely contains instructions, explanations, or metadata related to the data and supplementary files.

#### Summary of Datasets Used:

- The Social Conflict Analysis Database (SCAD) includes protests, riots, strikes, inter-communal conflict, government violence against civilians, and other forms of social conflict not systematically tracked in other conflict datasets.
- The Armed Conflict Location and Event Data Project (ACLED) collects real-time data on the locations, dates, actors, fatalities, and types of all reported political violence and protest events around the world.
- Uppsala Conflict Data Program-Georeferenced Event Dataset (UCDP-GED) is the world's main provider of data on organized violence and the oldest ongoing data collection project for civil war, with a history of almost 40 years. Its definition of armed conflict has become the global standard of how conflicts are systematically defined and studied.
- Crop Location Data
- Crop Calendar Charts

# Loading and Preprocessing the Data

Due to the lack of information in the dataset I had to navigate into the data and get familiar with it.

```
1
2 # load data
3 data <- read_dta("C:/Users/Antonio Felix/Dropbox/My PC (SHAW-72)/Downloads/
  AllDataMerged_15May2023_weighted.dta")
4
5 # Check the structure of the dataset
6 str(data)
7
8 # Getting familiar with the data
9 View(data)
10
11 # Understand the type of variables I have
12 head(data)
13
14 # Summarize the data
15 summary(data)
16
```

  

```

## Contribution

Generate R Studio Code for replication of the main tables and figures.

## Conclusion

About the dataset: Choosing a different academic paper where the code is already in R Studio, can avoid wasted time and allow us to focus on the paper's goal.
